FRESHROOTS · DEMAND PLANNING

Reorder Planner User Manual

SAP numbers in. One approval. Purchase orders out.

Analyst

Runs the plan.

Latest SAP data or a fresh upload, twice a week.

Raghav Kulkarni

Approves or rejects.

One decision. Nothing is ordered without it.

Procurement

Gets the orders.

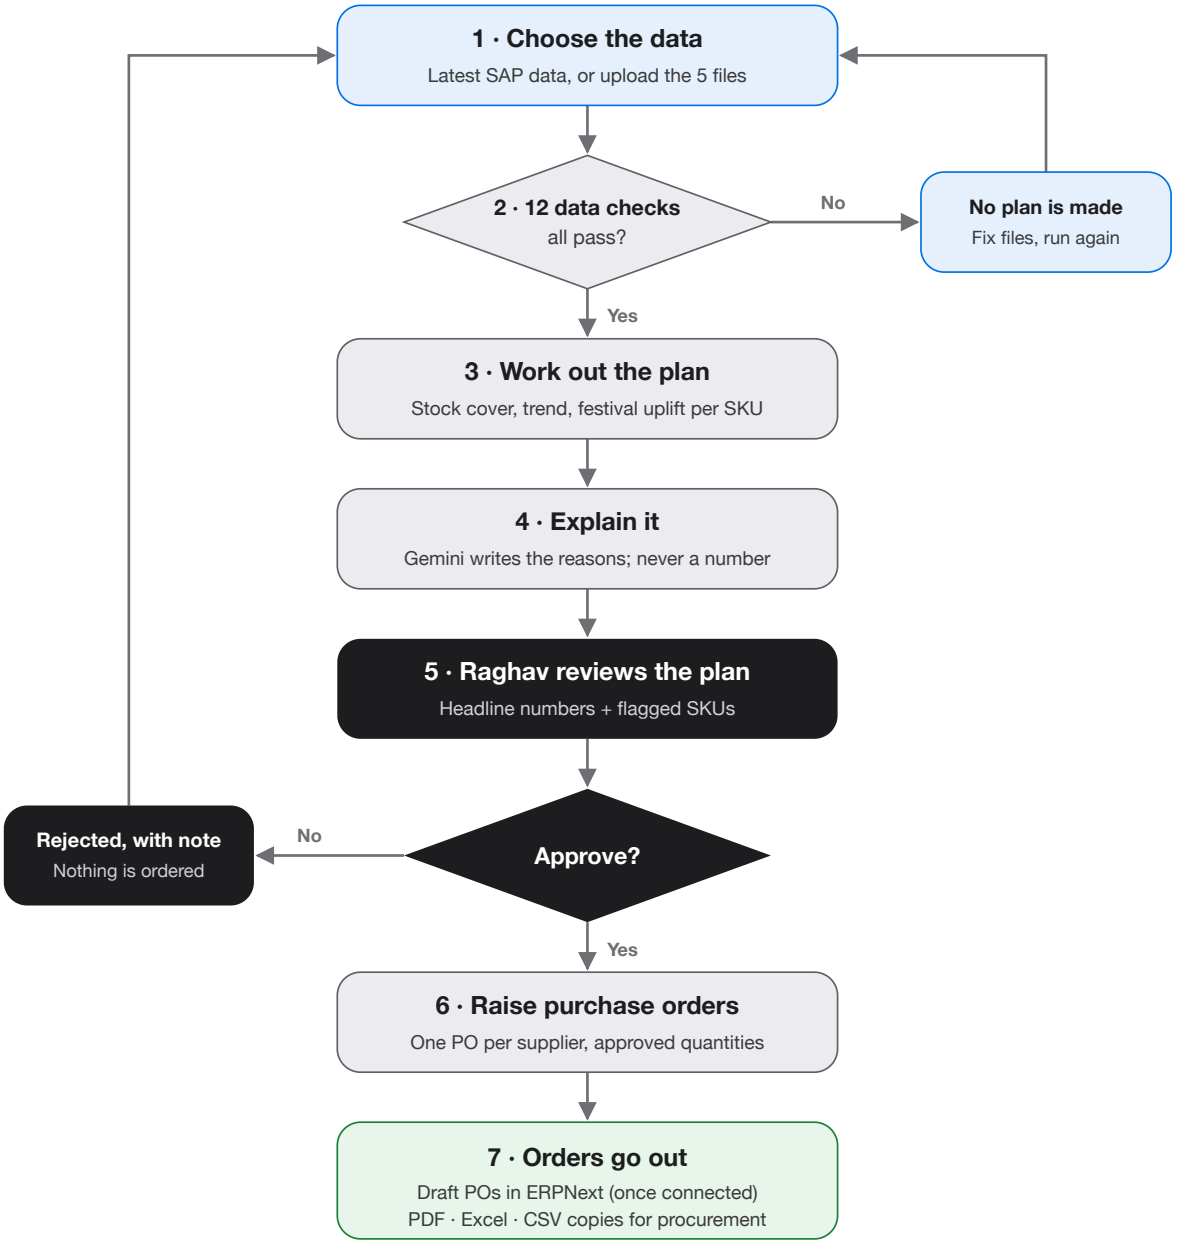

One purchase order per supplier, straight into ERPNext.

Website	**freshroots-reorder-planner.vercel.app**
In-app guide	**freshroots-reorder-planner.vercel.app/guide**
Code	**github.com/OMSOHANI07/freshroots-reorder-planner**
Rules	RULEBOOK.md, version 2.2 (pending sign-off by Raghav Kulkarni and Deepa Nair)
Date	23 October 2026

1. How it works

Seven steps. The colour shows who does each one.

Analyst · Planner (automatic) · Raghav · Procurement · ERPNext

2. Signing in

Open the website and press **Sign in**. Choose your role: **Analyst**, **Raghav Kulkarni** or **Procurement**. Your **Home** screen then shows your one next step.

The sign-in is a demo role picker for now. Add real logins before using it with live suppliers.

3. Analyst: run the plan

1. Go to **New run**.
2. Choose the data: **Latest SAP data** (files already uploaded; shows when and by whom), or **Upload new files** and drop the five CSVs exported from SAP: `weekly_sales.csv`, `sku_master.csv`, `current_inventory.csv`, `calendar.csv`, `distributor_master.csv`.
3. Press **Run the plan**. The 12 data checks tick through one by one.
4. **All passed:** the plan opens. You're done; it appears on Raghav's Home screen.
5. **A check failed:** no plan is made. Read the red message, fix the file, run again.

"Stock data is recent" failed? The stock date in `current_inventory.csv` is more than 7 days before today. Upload fresh data, or open **More options** and set the **Run date** within a week of the stock date (for replaying old data).

Optional · More options → Send a SKU to Raghav: add a SKU, a reason the data can't show (for example, a competitor promotion) and a valid-until date. That SKU isn't ordered automatically.

4. Raghav: approve or reject

1. **Home** shows "Plan #N needs your decision". Press **Review the plan**.
2. Read the three headline numbers: SKUs to reorder, units to order, SKUs flagged.
3. Read the flagged SKUs in the decision panel. Tap any SKU for 16 weeks of sales, stock cover before and after the order, the rules that fired, and the plain-language reason.
4. **Approve:** press **Approve plan**, add an optional note, press **Confirm approval**. Purchase orders are raised straight away.
5. **Reject:** press **Reject plan**, say why (required), press **Confirm rejection**. Nothing is ordered.

A single SKU's quantity can't be changed. To change something, reject the plan with a note and ask the Analyst to re-run.

5. Procurement: purchase orders

1. **Home** opens the latest approved plan; or go to **Plans** and pick one marked *Approved*.
2. Each supplier has one purchase-order tile with its lines, total units and status.
3. **Draft in ERPNext** — press **Complete order**, type each SKU's rate, pick the **Required By** date, press **Review**, then **Submit to ERPNext**. No ERPNext sign-in is needed.
4. **ERPNext sync failed** — the tile says why (for example, a supplier or item missing in ERPNext). Fix it in ERPNext, then press **Retry ERPNext**.
5. **ERPNext not connected** — use the downloads, enter the PO in ERPNext by hand, then press **Entered manually** and type the reference.
6. **Download** gives a PDF, Excel or CSV of one PO; **All as ZIP** gives everything for the plan.

There are **no prices or lead times** in the source data, so you type them in before submitting. The planner never guesses them.

6. Data

The **Data** page shows what the latest plan was built on. It's read-only and changes only with the next SAP upload.

- **SKUs** — name, supplier, perishability, standard order quantity, stock on hand, 16-week sales line.
- **Suppliers** — name, region, and how many SKUs each supplies.
- **Festival calendar** — festival months (expected demand +25%).
- **Overrides** — SKUs sent to Raghav by hand.

7. What the colours mean

Status	Meaning	What happens
Stockout risk	Stock lasts less than the minimum weeks	Reorder now: standard quantity, or 1.5× if sales are up more than 20%
Overstock	Stock lasts more than the maximum weeks	Pause the next order
Healthy	Stock cover is inside the window	No order now; next order 1.5× if sales are rising
Judgment zone	The rules can't decide	Nothing ordered automatically

Healthy windows: long-life SKUs 6–14 weeks of stock; perishable SKUs 3–4 weeks.

8. What the flags mean

A flag never changes a quantity; it asks for a closer look.

Flag	Meaning
R1	Even after the order, stock stays below the minimum
R2	Within half a week of a limit: a close call
R3	Sales spiked in a festival month; the uplift may count twice
R4	The order pushes stock above the maximum
J1	New product, or less than 12 weeks of sales
J2	Sent to Raghav by hand, with a reason
J3	No sales in 12 weeks, so cover can't be worked out

9. Questions

Who decides how much to order?
The rules engine, using Raghav's thresholds. Raghav approves or rejects the plan. AI only explains.

Who can change a rule or threshold?
Only Raghav, with sign-off from Deepa Nair (Head of Operations). See RULEBOOK.md, Section 16. Procurement and the Analyst can't.

When is a month a festival month?
Only when the festival calendar marks it. Today: March, October and November. Expected demand goes up 25%.

Why are there no prices on the POs?
The SAP files have no unit costs, and the planner never guesses. Procurement types the rates on each PO before submitting.

What if ERPNext is down or not connected?
The approval still stands and the POs are kept. Each one shows the reason and can be retried or entered by hand.

Where is the history?
History shows every plan, the rejection rate (the kill line is 40%), and the audit log of who did what and when.
